Computer Imaging Information & consent

Dr. Chaudhari has one of the few clinics in the Pune to offer state- of-the-art Computer Imaging. Computer Imaging of the face allows you to fully describe to the surgeon what is desired, and for the surgeon to illustrate what is possible.

After pictures are taken by digital camera, a computer is used to work with your image and portray any desired changes. This is very useful for profile changes such as in Rhinoplasty (cosmetic nasal surgery), Facelift or Chin augmentation. In certain cases, we can show you several different possibilities which can then be discussed. A final image that you like and which is attainable surgically is then decided upon as your goal. These images give you a good idea of the expected outcome of surgery. It must be remembered that Surgical outcome may not be the same as seen in computer generated images.

The use of the computer image can help alleviate unrealistic self-images that a patient may harbor. It may also help you gain the support of family members and friends because they will be able to see the proposed changes beforehand.

Computer imaging is powerful technology, and the goal is to provide you with a picture of a clinically achievable outcome. However, it is important to remember that it is a computer image only! You and your surgeon must discuss what is ultimately possible.

The best part about computer imaging is that it allows you to communicate to your surgeon exactly what you want. However no guarantees verbally or written can be given about surgical outcome .Computer generated pictures need not match postoperative photographs.Dr.Chaudhari does not give any verbal or written guarantee about the same.
